

A sail trim product
from the makers of

FURLEX

Rodkicker

The Rodkicker is a rigid vang which increases the ease and safety of trimming and reefing sails. It eliminates the need for a topping lift by preventing the boom from dropping into the cockpit or onto the cabin top. The Rodkicker is equipped with a gas spring which counteracts the weight of the boom, aiding sail trim in light air.

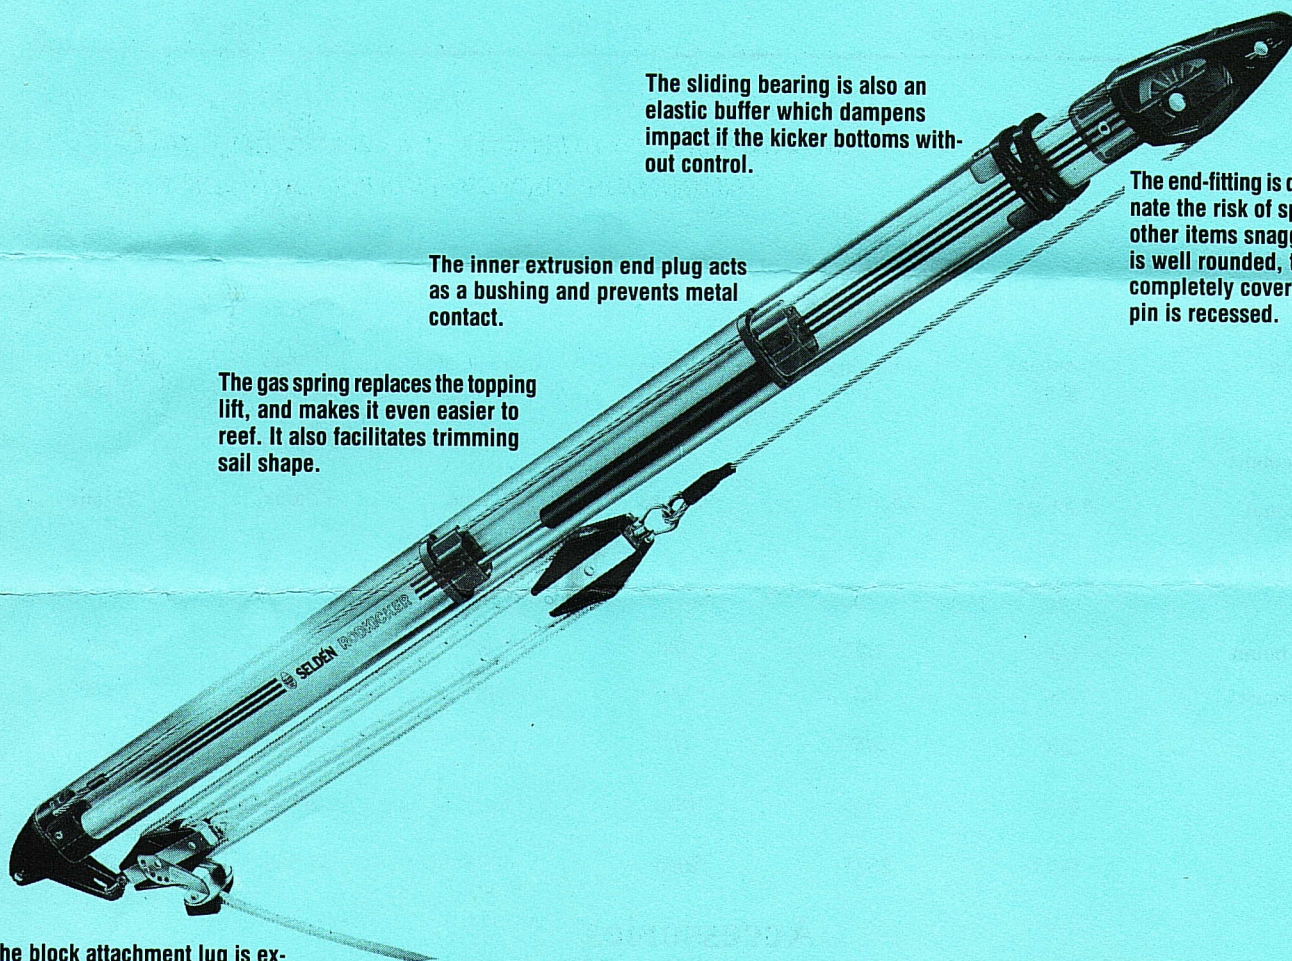

The sliding bearing is also an elastic buffer which dampens impact if the kicker bottoms without control.

The inner extrusion end plug acts as a bushing and prevents metal contact.

The gas spring replaces the topping lift, and makes it even easier to reef. It also facilitates trimming sail shape.

The end-fitting is designed to eliminate the risk of spinnaker guys or other items snagging. Its profile is well rounded, the sheave is completely covered, and the split pin is recessed.

The block attachment lug is extended to allow the block to turn so that the tackle may be handled from either port or starboard.
